[Effects of the pandemic crisis on urban mobility systems](#)

Body:

EIT Urban Mobility is working hard to understand the main challenges and strategies as well as the external factors that influence the design of urban mobility projects.

However, your input is required to provide a full picture. EIT Urban Mobility has designed a survey to gather insights on the effects the coronavirus crisis has had on urban mobility strategies and priorities - and which measures have been taken to react to the pandemic.

All insights gathered via the survey will be analysed by a European consortium currently working on a handbook to support cities in making their urban mobility systems more resilient and sustainable while taking the current pandemic as an opportunity for that transformation. The handbook will provide an evaluation of the mobility measures taken during the pandemic, a few months after their implementation.

Cities participating in the survey will all be acknowledged in the study and all dissemination activities following publication. Likewise, cities selected among the respondents will be invited to share their experience at events, webinars, and workshops.

Interested in having your say? You can contribute via the survey [link](#) (also provided below). Contributions will be collected until 31 October 2020.

For any questions regarding this survey, please contact [Yoann Le Petit](#), EIT Urban Mobility.
