Date of Production:

16 Oct 2007

Topic:

Urban mobility planning

Land-use planning is key to the way we travel because it affects where the activities that we undertake are located and therefore how far, and in what ways, we travel between them. This material was developed for training and learning sessions in Eltis to show, using international examples, how denser and more mixed use development can reduce the need to travel and the amount of travel by car. It also focuses at the land-use planning organisational structures that are necessary to deliver dense, mixed-use developments, some of the barriers to realising these types of developments, and how such barriers can be overcome.
